Thermal Tooling

Tooling for Staking, Swaging, Insertion, Sealing, Date Coding and Hot knife De-gating is commonly mounted to the upper portion of a press and heat is provided by probe or platen assemblies. Coil wound or cartridge heaters, with thermocouples, supply maintained heat to the tooling. Tips are commonly mounted to a probe or platen and are precision machined to produce the desired operation on your application. PAS utilizes the latest in technologies and finest materials to produce the highest quality products available. PAS manufactures tooling and supplies replacement components for all makes and models of machines. If you have a custom-built machine, call with your mounting dimensions.
